

```
local-data: "mycomputer.local. IN A 192.0.2.51"  
local-data: 'mytext.local TXT "content of text record"'
```

You can override certain queries with

```
local-data: "adserver.example.com A 127.0.0.1"
```

You can redirect a domain to a fixed address with (this makes example.com, [www.example.com](http://www.example.com), etc, all go to 192.0.2.3)

```
local-zone: "example.com" redirect  
local-data: "example.com A 192.0.2.3"
```

Shorthand to make PTR records, "IPv4 name" or "IPv6 name". You can also add PTR records using local-data directly, but then you need to do the reverse notation yourself.

```
local-data-ptr: "192.0.2.3 www.example.com"
```
